CIT **CLINICAL IMAGING TRIAGE**

End-to-end solution workflow

Actual prototype today + proposed clinical AI integration

● WORKING ● SIMULATED ● PLANNED Runtime: browser + Python API + SQLite on Ubuntu VM

1 Study enters queue

Demo case or imported PNG/JPEG. Authorized clinical feed is future.

CURRENT

2 Basic input checks

File type and size are checked. Clinical image quality is not.

CURRENT

3 Priority signal

Fixed fictional score and demo thresholds. No image inference.

SIMULATED

4 Prioritized worklist

Python API sorts cases; clinician sees wait and status.

CURRENT

NEXT: model inference on s390x

Licensed de-identified images, target finding, model version, confidence and safety checks.

5 Study review

Large viewer with zoom, pan, reset and fullscreen.

CURRENT

6 Clinician decision

Override priority with reason, or mark reviewed.

CURRENT

7 Activity record

SQLite stores actions; JSON activity can be exported.

CURRENT

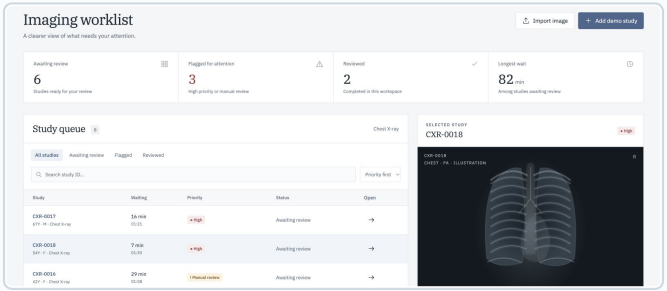

8 Validate impact

Future tests: missed cases, review time and clinician use.

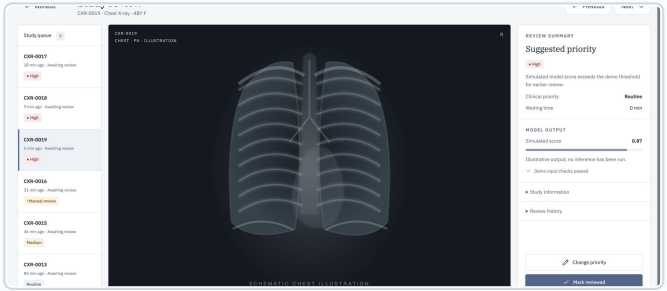

PLANNED

REAL INTERFACE EVIDENCE

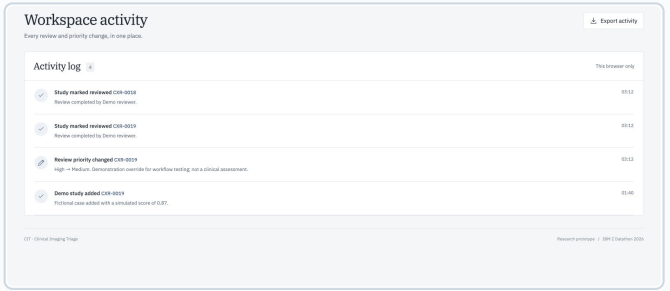

Worklist

Study viewer

Activity history

Prototype cases and scores are fictional; the chest image is schematic. No clinical model or validation exists.

LinuxONE s390x runtime is team-reported; independent VM capture is pending. Screenshots are from the standalone HTML demo.
